2. Essentially, in an ER diagram, there is no way to do this. The "is an Expert" relation has to be on the same level (equal) to the Type relation.

2. If the drug is only sold at one price, then we can add it as one of the attributes in Drugs, and remove it from the Sell relationship.

3. If we need to store several prescriptions to a patient, then we would need a new entity and the date attribute of a prescription would have to be removed (or stored for each time, but we don't want that). The new entity will have the date of the given prescriptions. This will have to be added to prescription relation, making it a 4 way relationship.
